
PROJECT PROPOSAL

UBR Esports Tournament & Wallet Platform

1. Executive Summary

In the fast-evolving esports ecosystem, BGMI and competitive mobile tournaments require automated, real-time platform solutions. The UBR Esports Tournament Platform is engineered to streamline match registrations, automate slot bookings, secure transaction flows (deposits/withdrawals), and provide a unified admin auditing system.

2. Project Objectives

- Automation: Remove manual entry validations for tournament slots and cash balances.
- Financial Ledger: Establish a secure, screenshot-validated deposit workflow and direct UPI/QR withdrawal ledger.
- High Accessibility: Provide responsive client dashboards for gamers on mobile and desktop devices.
- Auditable CMS: Equip administrators with dashboard controls to adjust balances, approve matches, and host results.

3. Proposed System Architecture

The application is structured using a robust Model-View-Controller (MVC) pattern:

- Model Layer: MongoDB schemas for strict validation of User wallets, Match categories, Point tables, and Withdrawal/Deposit logs.
- View Layer: Dynamic server-side rendering using EJS template engine combined with customized, lightweight CSS3 for optimized mobile rendering.
- Controller Layer: Express.js routers managing authentication checks (Passport Google OAuth 2.0), image uploads (Multer), and API dispatchers.

4. Core Feature Specifications

Google OAuth & User Profiles

Secure, passwordless authentication using Passport.js. Automates profile generation, profile pic synchronizations, and sets up a personal wallet instance.

Virtual Wallet & Transaction Log

Maintains ledger histories. Users request deposit loading by uploading payment screenshots. Users request cashouts by entering UPI IDs or uploading scanner QR codes.

Dynamic Match Bookings

Admin defines category slots, match titles, entry fees, prize pools, and schedules. System blocks entries automatically when slots are filled.

Financial Audit Dashboard

Comprehensive admin screen displaying pending deposits & withdrawal queues. Handles approvals/rejections and triggers auto-refunds upon rejection.

Leaderboard CMS & Points Tables

Standings uploads and cover page administration. Utilizes Cloudinary API to crop, compress, and host image assets securely.

5. Tech Stack Justifications

Node.js & Express.js

Event-driven, non-blocking I/O model is extremely lightweight and handles concurrent match registrations and user wallet actions smoothly.

MongoDB Atlas & Mongoose

Document database allows dynamic tournament structures. Atomic update operators (\$inc, \$gte) prevent double booking and double withdrawal race conditions.

Cloudinary Media Storage

Offloads storage from the main server. Provides globally distributed CDN delivery for fast loading of user QR codes and match scoreboard files.

6. Timeline, Investment & Milestones

The UBR Esports Platform development is planned over a 20-day timeline for a total investment of INR 57,000.

Phase / Milestone	Deliverables Focus	Duration
Phase 1: Setup	Google Auth, Database modeling, structure framework.	3 Days
Phase 2: Wallet	Screenshot deposits, QR withdrawals, balance logs.	5 Days
Phase 3: Bookings	Category lists, booking schedules, team limits.	4 Days
Phase 4: Admin CMS	Transaction audit dashboards, leaderboards.	5 Days
Phase 5: Launch	End-to-end integration tests, production setup.	3 Days

7. Support & Next Steps

To proceed with the project, the Client and Developer shall sign the Software Development Agreement. Development will kick off immediately upon receipt of the 40% advance payment. Developer will provide 30 days of post-deployment support to cover testing, debugging, and initial server optimizations.
